

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	30 September 2026
Team ID	SWTID-2026-5468
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	High Impact Field Control	UI Policy "High Impact Control" is created on the Incident table and kept active Condition: Impact is 1 - High, so the policy runs only for high impact incidents UI Policy Action makes Assignment group mandatory Reverse if false is set to true, so the change is undone when Impact is no longer High
FR-2	Urgency Field Control	UI Policy Action on the Urgency field with Read-only = true Visible is left unchanged, so the field stays on the form but cannot be edited Urgency becomes editable again when Impact changes to another value
FR-3	Automatic Urgency Update	onChange client script on the Impact field Script does nothing while the form is loading or when the new value is empty When Impact is set to 1 - High, Urgency is set to 1 - High using g_form.setValue Info message "Urgency set to High for High impact incident." is displayed
FR-4	Save-time Validation	onSubmit client script on the Incident form When Impact is High and Assigned To is empty, the save is stopped (returns false) Error message "Assigned To is mandatory for High impact incidents." is shown on the Assigned To field Record saves normally once Assigned To is filled

FR-5	List Edit Restriction	onCellEdit client script on the State field of the Incident table Alert tells the user that State cannot be updated using list editing and to open the Incident Change is cancelled (callback(false)), so the State value remains unchanged
FR-6	Form-based State Update	State can still be changed from the Incident form Save succeeds while the other rules (UI Policy and client scripts) continue to apply
FR-7	Reverse Condition Handling	When Impact is changed from High to Medium, the Assignment group mandatory setting is removed Urgency becomes editable again and the onSubmit check no longer blocks the save Record saves successfully without errors
FR-8	Testing and Verification	Test 1: High impact with Assigned To empty is blocked with an error message Test 2: High impact with Assigned To filled saves successfully Test 3: Reverse condition test (High to Medium) Test 4: List edit of State is blocked with an alert Test 5: State update from the form is saved successfully

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The form gives clear, immediate feedback so users know what to do: an info message when Urgency is set automatically, an error box on the Assigned To field when a save is blocked, and an alert when a list edit is not allowed. Field names and messages use the same wording as the Incident form.
NFR-2	Security	The UI Policy and Client Scripts can be created or changed only by users with administrative or configuration access. Access to Incident records continues to follow the standard ServiceNow roles and access controls, and the rules make sure High

		impact incidents always have the required ownership data.
NFR-3	Reliability	The same rules run every time the conditions are met, so results are predictable. Reverse if false restores the fields when Impact is no longer High, and the client scripts return without action when the form is loading or the value is empty.
NFR-4	Performance	Validation and field behaviour run in the browser (client side), so users get immediate feedback without waiting for a server round trip. The scripts are short and only run for the Incident table and the specific fields involved.
NFR-5	Availability	The controls are part of the ServiceNow instance configuration, so they are available whenever the Incident form and Incident list are available. No separate service or external system is needed.
NFR-6	Scalability	The rules are defined once on the Incident table and apply to every Incident record, so they keep working as the number of incidents and users grows. More fields or conditions can be added later using the same UI Policy and Client Script approach.
